Q: Extracting data from a function and inserting it in variable in Racket I'm new to Racket and I'm wondering how to extract data from a function and insert it into a variable. Here is my problem: I am working in a Scheme interpreter and I'm reading a file that contains the description of the function; then I want to extract a description as a list of symbols and store the description in a variable. This is the example of the structure of the file: (define a 10) (define b 3) (define c 10) (define d 20) (define e 90) (define (f x) (if (
