Windows 10 Home edition product key and activation code. activator for Windows 10 Home edition.Q: Linking a C library to a dynamic library - Segmentation Fault I tried to link to the Hippi library to make a simple standalone program. The gist is that hippi is a c library meant to be installed on top of a dynamic library. As such I have a simple c program which initializes hippi using dlopen, when it tries to use any of its functions (hippi *()) it gets a segmentation fault. I am linking using gcc -dynamiclib -ldl -lhippi I have provided my code (couldn't find a working example on the internet) #include #include int main(){ hippi st hippi; hippi init(&hippi); } Is there any way to force the linker to link the library when calling its functions? Or is there a way to get a proper dlopen to work? A: Aha found it. The issue was I was compiling (using acc.) the shared library as static. Changing the options to gcc -shared -ldl -lhippi the program compiled and executed fine. Using dld / dlopen on the shared library made it look like a dynamic library but the functions actually had extern "C" which made it compiled as a static library. Removing this solved the issue. Additionaly the Hippi library can not be linked to a self contained exe. I solved it by copying it into the program c6a93da74d
